

The NetLock

by *Cygnus*

Access has never been so easy...
...or more secure.

Say goodbye to forgotten passwords, combinations and keys. Say hello to easy-to-use proximity card access with powerful backside administration.

Ease of Use

Imagine one card that can simplify your workflow as well as strengthen your control over the access to medications and assets.

The NetLock eliminates the need to remember a password, a combination or key to open a cabinet. Now, a simple swipe of a proximity card can get you into the cabinet. The lock then sends a packet of information to the administrative server which contains the cabinet location, caregiver identification and time the cabinet was opened.

Administrative Power and Accountability

Being accountable for medical and computer assets is an important responsibility. That job just got easier with the powerful and easy to use NetLock.

The NetLock security system enables administrators to lock down permissions to the contents of a cabinet. The administrative software can drill down to track the access of individual caregivers as well as audit the access into a specific cabinet.
